## Supplemental Methods

Equation for phenology models: Response variable ( $y$ ) is day of year of the phenological event (budburst, leafout, or flowering). Predictors are measured air temperature ( $T$ ) and soil moisture( $SM$ ). Random effects are species (sp, random slopes and intercepts), and site and year nested within site (random intercepts).

$$y_i = \alpha_{sp[i],site[year[i]]} + \beta_{temp_{sp[i]}} + \beta_{mois_{sp[i]}} + \beta_{temp:mois_{sp[i]}} + \epsilon_i \quad (1)$$

$$\alpha_{sp} \sim N(\mu_{sp}, \sigma_{sp}) \quad (2)$$

$$\mu_{site[year]} \sim N(\mu_{siteyr}, \sigma_{siteyr}) \quad (3)$$

$$\mu_{site} \sim N(\mu_{site}, \sigma_{site}) \quad (4)$$

$$\beta_{temp_{sp}} \sim N(\mu_{\beta_{temp}}, \sigma_{\beta_{temp}}) \quad (5)$$

$$\beta_{mois_{sp}} \sim N(\mu_{\beta_{mois}}, \sigma_{\beta_{mois}}) \quad (6)$$

$$\beta_{temp:mois_{sp}} \sim N(\mu_{\beta_{temp:mois}}, \sigma_{\beta_{temp:mois}}) \quad (7)$$

## References to include

- Later flowering is associated with low precipitation, at least in part (Crimmins et al 2010)
- Ganjurjav et al 2020
- Cabon 2020

## Supplemental Tables

Table 1: **Experimental sites and phenophases included in the ExPhen database.** Experimental sites correspond to the map (Figure S1). We give the study ID, location, source, years of data included, ecosystem, number of species, and phenophases included: budburst (bb), leafout (lo), flowering (fl), fruiting (fr), or senescence (sen) day of year. Note that some sites may have multiple sources; however, we list only one here.

study	location	source	data years	ecosystem	species	phenophases
exp01	Waltham, MA, USA	Hoepfner and Dukes 2012	2009-2011	grassland	44	bb,lo,fl
exp02	Montpellier, France	Morin et al. 2010	2004	temperate deciduous forest	5	fl,fr
exp03	Duke Forest, NC, USA	Clark et al. 2014	2009-2014	temperate deciduous forest	37	bb,lo
exp04	Harvard Forest, MA, USA	Clark et al. 2014	2009-2012	temperate deciduous forest	29	bb,lo
exp07	Harvard Forest, MA, USA	Pelini et al. 2011	2010-2015	temperate deciduous forest	8	bb,lo,sen
exp09	Stone Valley Forest, PA, USA	Rollinson and Kaye 2012	2009-2010	temperate deciduous forest	120	lo,fl,fr,sen

## Supplemental Figures

Questions for co-authors:

1. Life forms vs ecosystems figures: Life forms plots histograms of species level effects whereas ecosystems plots all posteriors- what's your preference?
2. what do you think of density plots: is it fair to say that variance is greater for temperature, even though the variances relative to the mean is about the same?

Figure 1: **Effects of temperature, soil moisture, and their interaction do not differ strongly across life forms** for leafout (top) and budburst (bottom) models. Histograms show species-level estimated effects for temperature, soil, and their interactions across four life forms (trees, shrubs, herbs, and grasses).

Figure 2: Effects of temperature and soil moisture do not differ strongly across ecosystems (forest vs grassland) for leafout (top) and budburst (bottom) models..
